

Brake system measurements

1. **Measurement:** depth of the hole through the shaft. Insert the rear measuring pole of the caliper, through the hole in the steering shaft (see figure 1). When you reach the end measure the distance to the end of the threaded steering shaft. Make sure the rear measuring pole of the caliper is touching the end of the hole in the shaft (see figure 2). **Example in the pictures below.**

Figure 1

Figure 2

2. **Measurement:** distance from threaded shaft to the front face of the steering wheel (see figure 4). Once again use the rear measuring pole of the calipers to measure the distance from the front plate of the steering wheel to the start of the threaded shaft (see picture 3 / 5). **See example in the pictures below.**
